

When your application is down you lose customers trust, their loyalty and your business suffers. Your application should be smart enough to stay running. That's why at Rampart AI™ we are making application resiliency the next frontier.

Resiliency Built-in For Your Business Applications:

1. Understand the Application

Rampart™ provides a complete, detailed review of how an application will behave in production. Rampart provides a resilient solution that is focused on ensuring your application runs as expected.

Complete visibility into application behavior

2. Identify Security Risks That Exist in the Application

Rampart will deliver an assessment of your application, identifying the risks beyond vulnerabilities that exist in your application, including open source and software supply chain risks that can be exploited.

Protection against software supply chain attacks

3. Delivers Zero-Trust Applications to Production

Rampart automatically integrates application resiliency directly into the build and test process, monitoring and alerting on all anomalous behaviors. Rampart protects against zero-day attacks.

True application protection against zero-day attacks

Application Protection Cycle (APC):

With Rampart you get complete application security and resiliency. The APC shows you the foundation needed for your application to run as expected. Rampart plays a role in each step of the APC, when Rampart is deployed your application runs as expected.
